CAREER DEVELOPMENT / 2026

Post-Bootcamp Roadmap & Career Planning

Walid Barakat | i@work | Prepared 10 October 2026

Planning window: 12 October to 10 December 2026. Day 30: 10 November. Day 60: 10 December.

ENERGY EXPERIENCE + PRACTICAL AI

Two role targets. One focused portfolio. A dated 60-day plan.

Includes role-market evidence, skills mapping, case-study copy, certification planning, outreach drafts, gap analysis and submission checks.

Planning draft with transparent evidence limits. Future actions remain unperformed until recorded by the owner.

1. Direction and evidence boundaries

My primary target is Technical AI Consultant, with Digital Transformation Consultant as a complementary route into energy-sector engagements. My strongest positioning combines energy-sector experience, project management and practical AI prototyping. I want clients to understand what a system can do, what its evidence supports and where a person must make the final decision.

This is a completed planning draft, not a record of completed future activities. First-person reflections are proposed wording based on my shared background and should be reviewed for personal accuracy. Project narratives use previously described bootcamp work; the source repositories and runtime results have not been audited for this lab. No revenue, accuracy, time saving, certification award or employment outcome is claimed.

The supplied lab is optional and gives no numerical grading rubric. It requires GitHub submission only if the work is shared for review, with Markdown or PDF notes in a repository dedicated to this lab. This package covers Kick-off, all five CFU checkpoints, Core Tasks 1-4, Reinforce and Stretch. Activities such as sending outreach, subscribing, booking an exam and importing calendar events remain future actions.

Decision rules

- Prioritize energy consultancies, utilities, infrastructure teams and public-sector transformation work where my domain experience is useful.

- Use Germany and EU-based opportunities first; treat international postings as skills evidence unless language, location and work conditions fit.

- Keep one main portfolio story: EU Tender Intelligence. Use Grid Connection Pre-Check as a second, explicitly limited prototype story.

- Prefer a small reproducible demonstration and a clear limitations statement over unsupported claims of production readiness.

2. Kick-off reflection and role targeting

Question 1: Which weeks were most energizing?

Weeks 3, 4 and 6 are my proposed choices. In Week 3, retrieval and tool integration gave me a way to connect language models with energy-sector information. Week 4 made the work tangible through LangGraph and n8n: separate steps could become a repeatable workflow. Week 6 added the questions I would face as a consultant, including whether an output is reliable, how it should be evaluated and what risks need explaining to a client. The attraction was the combination of a working system and a defensible recommendation.

Question 2: What work would I choose daily?

Advising clients is my first preference, supported by building and testing prototypes. I also value managing delivery when it helps a team move from a business question to a useful result. A proposed working mix is 40% discovery and advice, 35% prototyping and evaluation, and 25% delivery coordination and communication. These percentages are a planning preference, not measured time use.

Question 3: What would I avoid?

I would avoid roles dominated by isolated coding with little client or sector context, or administrative reporting without influence over decisions. I do not want to sell an AI system on the strength of a polished demonstration alone. I am willing to debug integrations and document delivery because those activities make my advice more credible.

Target role	One-sentence rationale	Priority bootcamp review
Technical AI Consultant	I want to combine hands-on energy AI prototypes with clear advice about feasibility, evidence and implementation trade-offs.	Weeks 3-4 and 6: RAG, LangGraph, MCP, n8n, evaluation, tracing and responsible AI.
Digital Transformation Consultant	My energy-programme and project-management background fits the work of turning technical possibilities into scoped changes that stakeholders can adopt.	Weeks 2-4 and 7: classical PM, Kanban, Scrum, XP and demonstrations of the AI toolchain.

3. Task 1: Market check and skill mapping

Research date: 10 October 2026. Exact search phrases were "Technical AI Consultant" and "Digital Transformation Consultant", initially with Germany and then broadened to Europe and relevant international comparators. Four readable LinkedIn postings per role were examined. Employer-authored requirements were paraphrased. Similar-job recommendations, expired redirects and duplicate EPAM listings were excluded from the counts.

This is a small directional sample, not a statistical labour-market study. Displayed relative ages are recorded as seen, not converted into invented publication dates. Closed postings can show requirements but are not current application leads. The technical sample includes two older benchmarks because several newer URLs redirected; the lab's preference for 3-5 recent postings is therefore only partly met for that role. Refresh that sample on 13 October before submission if strict recency is required.

Technical AI Consultant: four-posting sample

ID and employer	Displayed age / status	Requirement evidence and relevance
T1 Aivisory, Germany [S1]	3 months; closed	AI architecture, customer requirements, workshops, technology selection, integration, German and English communication. Germany relevance; older benchmark.
T2 Ignite AI Partners, UK [S2]	2 weeks; closed	Discovery, AI solution concepts, RAG and agents, integration needs, governance, delivery and business value. Retail comparator; UK eligibility needs checking.
T3 iQube IT Consulting, Portugal [S3]	8 months; closed	Python, APIs, vector databases, agent frameworks, RAG and technical workshops; cloud exposure preferred. Older technical benchmark; hybrid and language conditions matter.
T4 EPAM Systems, Armenia [S4]	1 week; Apply shown	Python, React, LangChain/LangGraph, MCP, client collaboration and end-to-end delivery. Remote within Armenia, not confirmed remote from Germany.

Digital Transformation Consultant: four-posting sample

ID and employer	Displayed age / status	Requirement evidence and relevance
D1 Vienesse Consulting, Austria [S5]	4 weeks; Apply shown	Transformation/consulting/project experience, analytical communication, AI and cloud interest, ownership. Energy is among its client sectors.
D2 Harmony Group, Belgium [S6]	1 month; closed	Process analysis, requirements, project management, business modelling and client collaboration; Dutch, English and French fluency. Language mismatch today.
D3 eSense, Saudi Arabia [S7]	1 week; Apply shown	Qiyas readiness, evidence tracking, stakeholder workshops, project delivery, Arabic and English. Qiyas experience and onsite availability are material gaps.
D4 BayInCo Marketing, Sweden [S8]	3 days; closed	SME digital strategy, maturity analysis, roadmaps, workshops, change and measurable value. Senior title variant; specific external SME consulting evidence required.

Top five recurring skill families

Count a family once per posting when the role explicitly describes it. Broad families group related responsibilities; they do not mean that all employers request the same tool. "Have" below means background or project experience described by me, not independently verified mastery.

Role / skill family	Count and evidence IDs	Experience I can discuss	Evidence gap or next step
Technical: client communication and discovery	4/4: T1-T4	Energy consulting and capstone explanations	Record a concise discovery-to-demo walkthrough.
Technical: AI design and solution selection	4/4: T1-T4	Tender workflow architecture	Defend two design alternatives with evidence.
Technical: integration into client systems	4/4: T1-T4	APIs, n8n and agent orchestration	Demonstrate failure handling and secure configuration.
Technical: practical delivery/prototyping	4/4: T1-T4	Tender and grid proof-of-concept work	Fresh setup and repeatable demonstration.
Technical: LLM/RAG/agent methods	3/4: T2-T4	LangGraph, RAG and tool use	Quantitative retrieval and answer evaluation.
Digital: client/stakeholder communication	4/4: D1-D4	Multi-stakeholder energy programmes	Capture structured feedback from a mock workshop.
Digital: analysis and problem solving	4/4: D1-D4	Tender assessment and project scoping	One documented baseline-to-target process map.
Digital: project/action-plan delivery	4/4: D1-D4	PMP background and capstone planning	Link roadmap actions to owners and acceptance criteria.
Digital: digital/IT business understanding	4/4: D1-D4	Energy processes plus AI prototype work	Explain integration and adoption constraints clearly.
Digital: process improvement/readiness	3/4: D2-D4	Bid/no-bid decision workflow	Measure user adoption and operational outcomes.

Three-plus bootcamp skills mapped to both roles

Skill and project evidence	Technical AI Consultant use	Digital Transformation Consultant use
API integration and n8n, Tender Intelligence	Build and troubleshoot repeatable workflows	Map the manual process and identify useful automation.
RAG, LangGraph and MCP, Tender Intelligence	Explain retrieval, tool boundaries and orchestration	Demonstrate feasibility and dependencies to stakeholders.
Evaluation and responsible-AI labs	Test outputs, document errors and escalation	Define acceptance criteria and governance ownership.
PM, Agile and capstone decision gate	Deliver a scoped prototype in increments	Prioritize requirements, manage change and track benefits.
Grid Pre-Check presentation	Explain deterministic calculations versus AI interpretation	Communicate a limited screening service and approval boundaries.

4. Task 2: Portfolio narratives

These are proposed first-person case-study summaries based on work already described. Confirm each sentence against the final project files before using it in an application. Outcome statements describe an artifact or demonstrated approach, not validated client benefits.

Project 1: EU Tender Intelligence

Energy consultancies need to decide which funding opportunities deserve attention before spending time on proposals. I developed an EU Tender Intelligence prototype that connects opportunity intake with structured assessment and a bid/no-bid decision workflow. The project brings together Python, n8n and an agent-based design so that information gathering, assessment and reporting can be explained as separate steps. It produced a demonstrable approach to organizing decision evidence and made integration, credential and dataflow failures visible during development. The next validation step is to compare its recommendations and processing time with a documented human baseline; no measured productivity improvement is claimed yet.

Project 2: Grid Connection Pre-Check

Early grid-connection discussions need a clear view of what can be screened before a detailed engineering study. I developed a Grid Connection Pre-Check proof of concept using pandapower calculations and a consulting presentation that separates engineering analysis, AI explanation and human approval. The scope focused on communicating a preliminary screening result and its limitations. The output demonstrates how technical calculations can support an understandable client conversation without presenting the prototype as a formal connection decision. Independent engineering review and a benchmark against a validated case remain necessary before operational use.

Portfolio evidence and acceptance criteria

Project	Evidence to attach by 25 October	Acceptance criterion
Tender Intelligence	Architecture diagram, setup instructions, sample input/output, dated run record, limitations, commit identifier	A reviewer can reproduce one documented sample and trace an assessment back to its inputs.
Grid Pre-Check	Assumptions, model input, calculation output, explanation and engineering-review boundary	A reviewer can distinguish a computed value, an AI interpretation and a human approval.

The existing tender repository reference is the EU Tender Autonomous Agent repository. It is an evidence destination supplied in earlier project context, not a repository audited in this package. Keep this lab in its own repository and link to project evidence rather than copying entire projects into it.

Responsible-AI story

In the tender project, a persuasive summary can conceal missing information or uncertain interpretation. My proposed portfolio story explains why source references, explicit unknowns and human review matter before a bid decision. The next demonstration should include a missing-source case that is escalated instead of silently treated as reliable. I will also document which input fields are needed, remove unnecessary personal information from shared examples, and record model calls and token use when comparing workflow options. These are planned controls and validation evidence, not a claim that all safeguards already operate or that legal compliance has been certified.

5. Task 3: Certification choice and 30-day plan

Selected credential: IAPM Certified Agile Project Manager. It meets one of the lab's named options and gives a focused way to strengthen Agile delivery vocabulary alongside my existing PMP background. Its incremental value should be tested against target roles rather than assumed from the credential alone. I will study one certification during this period and reserve most portfolio effort for observable delivery evidence.

IAPM currently specifies 120 questions, 80 minutes and a 65% pass threshold. Its preparation route uses free web learning and an optional paid self-test; fees depend on citizenship and must be checked before purchase. The certificate does not require recurring recertification [S9-S10]. This plan does not constitute registration or payment.

The lab's Microsoft section needs updating: the official Azure AI Fundamentals page currently lists AI-901 as its required exam [S11]. Azure fundamentals is Microsoft-specific, so calling it vendor-neutral is misleading. If I later choose this route, I will use the current official syllabus and booking details rather than copy the old AI-900 format from the lab.

Dated weekly template

Week and dates	Certification focus	Bootcamp review	One concrete weekly output
1: 12-18 Oct	Agile foundations, Scrum roles and events; initial knowledge check	Weeks 2 and 4: PM and Scrum	By 18 Oct: one-page Scrum map and a scored baseline quiz with weak topics recorded.
2: 19-25 Oct	Kanban, work in progress, user stories and release planning	Weeks 3-4: workflow planning	By 25 Oct: a 10-item tender backlog with acceptance criteria and a Kanban policy.
3: 26 Oct-1 Nov	XP, collaboration and light retrieval practice; reduce load during campus week	Week 7: XP	By 1 Nov: a one-page comparison of Scrum, Kanban and XP with three project examples.
4: 2-8 Nov	Self-test, targeted revision, exam-registration decision	Weeks 3-4 and 6: weakest topics and portfolio clarity	By 8 Nov: readiness record; submit registration only after fee and readiness checks.
Days 29-30: 9-10 Nov	Final review and practical exam scheduling	Case-study walkthrough	By 10 Nov: exam target date confirmed or a dated remedial plan.

Target exam date: 17 November 2026, conditional on readiness and availability. Personal readiness gate: at least 80% on two different practice sets, completed without notes, with errors explained. This is my planning threshold, not an IAPM rule. If unmet, repeat weak domains and reassess on 24 November; do not describe a planned exam as a passed credential.

Weekly capacity

Normal weeks: 6 hours in total, comprising 2.5 hours certification, 1.5 hours technical repetition/portfolio and 2 hours outreach, applications and review. Suggested study blocks are Monday, Wednesday and Friday 18:00-18:30 plus Saturday 09:00-10:00, Europe/Berlin. These are proposed slots, not checked against a live calendar.

During 26-30 October and 7-10 December, reduce to short review and follow-up blocks because of the previously described campus commitments. Other coursework deadlines around 11, 18 and 25 October and 8 November also justify this conservative workload. If less time is available, protect one portfolio output and one meaningful contact each week before adding another course.

6. Gap analysis and technical repetition

The following gaps are proposed priorities based on the job sample and the evidence currently described. They are not a formal assessment of proficiency.

Role	Specific gap	Concrete action and evidence	Deadline
Technical AI Consultant	Repeatable RAG evaluation and tracing	Revisit Week 6; create 20 fixed tender questions with expected supporting sources. Compare two retrieval configurations and record answer support, missing citations, latency and cost.	22 Oct 2026
Digital Transformation Consultant	Measured adoption and benefits	Revisit Weeks 2-4 and 7; prepare a current/future workflow, owner map, five user stories and three KPIs; run one mock stakeholder walkthrough and record actual feedback.	5 Nov 2026
Technical AI Consultant	Deployment and fault recovery	Run a documented sample from a clean setup; exercise one timeout, one invalid credential and one missing field; record safe failure and recovery.	12 Nov 2026
Digital Transformation Consultant	German client delivery	Rehearse a three-minute energy AI explanation in German; ask a fluent reviewer for feedback on clarity and terminology.	19 Nov 2026

Four weekly hands-on repetitions

Date	Exercise	Definition of done
15 Oct	API input validation	Save one successful response and one handled invalid input; explain the failure.
22 Oct	RAG evaluation	Save the fixed test set, settings and comparison table; label small-sample limitations.
29 Oct	n8n failure-path desk rehearsal	Trace a timeout and retry on paper for 30 minutes during campus week; executable validation follows on 12 Nov.
5 Nov	Stakeholder walkthrough	Obtain one review of the process map; document what changed and why.

Proposed evaluation record

For every test, log date, commit, input identifier, expected behaviour, observed behaviour, pass/fail, source references, latency, model/token cost where available and corrective action. For the 20-question set, calculate supported-answer rate as supported answers divided by all questions; report abstentions separately. Do not let a high average conceal a missing mandatory condition. For business value, compare median manual and assisted review time on the same small sample, including human correction time. Leave all performance fields unfilled until runs exist.

7. Days 31-60: From portfolio to conversations

Period	Priority	Concrete result
11-17 Nov	Demonstrate reliability; certification attempt if ready	Dated failure-path evidence and exam attempt record or revised date.
18-24 Nov	Test the consulting offer	One mock discovery session, German rehearsal and two tailored applications.
25 Nov-1 Dec	Improve the story using feedback	Revise one case study; produce a one-page pilot scope with exclusions and acceptance criteria.
2-8 Dec	Interview preparation; lighter campus-week load	Rehearse a five-minute technical case plus a five-minute business case; maintain essential follow-ups.
9-10 Dec	60-day review	Record applications, conversations, evidence quality and certification status; choose the next 30-day focus.

Sustainable weekly quota

Normal-week targets: three tailored outreach messages, two well-matched applications and one useful professional conversation requested or held. A requested conversation is not counted as a held conversation. Minimum during campus weeks: one follow-up and one job review. Proposed Monday 18:30-19:30 block covers applications; Thursday 18:30-19:00 covers outreach; Friday 18:30-19:00 covers follow-ups and metrics. Adjust these times before importing the calendar if they conflict with study or work.

Decision metrics

Track messages sent, replies received, conversations held, applications submitted and interviews offered, with dates and links. Reply rate equals replies divided by messages sent; interview rate equals interviews divided by applications, with zero-denominator cases marked not applicable. At the 10 November review, if six carefully targeted messages across two weeks produce no replies, revise the introduction and evidence link before increasing volume. At 10 December, choose the route producing stronger qualified conversations and the work I want to perform; do not infer failure from a small sample alone.

A focused i@work pilot offer

Proposed offer: a two-week discovery and feasibility engagement for an energy consultancy's tender-screening process. Deliverables would be a process map, a small evidence-linked prototype, an evaluation record and an implementation recommendation. Scope would exclude automatic bid submission and guarantees of funding success. Pricing and effort should follow discovery, access constraints and an agreed acceptance test; this document does not invent a commercial quote or contracted client.

8. Reinforce: Outreach, contacts and learning cadence

These are drafts only. No messages have been sent and no contacts have been researched or added to an external service. Replace company-specific details after checking an actual current vacancy; do not send the same message indiscriminately.

Technical AI Consultant: three-sentence introduction

Hello, I am Walid Barakat, an energy-sector consultant developing practical AI workflows through i@work. My EU Tender Intelligence prototype combines Python and n8n in a structured assessment workflow, and I would welcome a conversation about technical AI consulting opportunities with your team. I am particularly interested in applying these skills to energy-sector decisions where clear evidence and human review are essential.

Digital Transformation Consultant: three-sentence introduction

Hello, I am Walid Barakat, and my background combines energy programmes, project management and hands-on AI prototyping. My Grid Connection Pre-Check proof of concept uses process scoping and stakeholder communication to explain how a preliminary technical assessment can support an engineering conversation. I am interested in transformation work in the energy sector because successful adoption depends on delivery, trust and a clear business purpose as well as technology.

CRM-lite starter actions

Contact category	Purpose	Next action date	Status
Bootcamp instructor	Feedback on target roles and case studies	14 Oct	Draft a focused feedback request; not sent.
Bootcamp peer	Reproducibility and portfolio clarity review	16 Oct	Invite a 15-minute review; not sent.
Career services contact	Validate two-role CV positioning	20 Oct	Prepare CV and role sample; not sent.
Energy-sector professional contact	Test the relevance of the tender pilot	23 Oct	Select an appropriate known contact privately; not sent.
Relevant recruiter or hiring manager	Discuss a verified open role	6 Nov	Select a suitable posting and personalize the introduction; not sent.

Keep names, private contact details and correspondence in a private CRM copy. The repository includes a category-based tracker only. Record actual contact dates after sending, then set a follow-up date about seven days later if appropriate.

Law/policy and technical cadence

On 14 October, review the European AI Office page and use an official subscription option if available, otherwise bookmark its updates [S12]. Monthly blocks on 6 November and 4 December, 12:30-13:00 Europe/Berlin, are reserved for reading and recording one implication for my consulting practice. Subscription is not completed by this package. The four hands-on repetitions in Section 6 cover the technical cadence; continue fortnightly evaluation checks after the first month.

9. Stretch: Positioning and all eight roles

Technical AI Consultant positioning

Technical AI Consultant focused on energy-sector workflows. Through i@work, I developed an EU Tender Intelligence prototype that connects AI-assisted information processing with a structured assessment process. I bring energy-domain experience and project-delivery discipline to explaining what a prototype can demonstrate and what still needs validation.

Digital Transformation Consultant positioning

Digital Transformation Consultant focused on practical AI adoption in energy. My Grid Connection Pre-Check proof of concept connects engineering screening with a clear client-facing explanation and a human approval boundary. I help frame technical work around scope, stakeholder needs and usable evidence.

Plain-language clarity test

On 16 October, show both statements to one person unfamiliar with the bootcamp. Ask: What work do I do, who is it for, and what would you expect me to deliver? Record their actual answers in the feedback tracker and revise any phrase they cannot explain. No reviewer feedback is assumed here.

Full gap analysis across the eight lab roles

Role	Could I credibly interview today? Biggest gap	Review
AI Automation Developer	For scoped prototype roles, subject to a code walkthrough; the gap is tested, maintainable deployment and operational support.	Weeks 2-4
AI Automation Analyst	For entry evaluation discussions, with clear limits; the gap is a reproducible statistical comparison and KPI dashboard.	Weeks 1, 6, 7
AI Consultant	For energy use-case and adoption advisory, yes on described experience; the gap is documented client outcomes and independently reviewed governance work.	Weeks 2, 6-7, 8 Day 4
Technical AI Consultant	A strong target for scoped engagements; the gap is credible evaluation and failure-recovery evidence beyond a demo.	Weeks 3-4, 6
AI Strategy Analyst	Plausible for energy-focused roles; the gap is an investment-prioritization case with validated assumptions and sensitivity analysis.	Weeks 6-7, 8 Day 4
Digital Transformation Consultant	A strong target using prior energy/PM experience; the gap is measured adoption and benefits in an AI change programme.	Weeks 2-4, 7
AI Solutions Architect	A longer-term target rather than a senior claim today; the gap is production-scale security, availability, cost and integration design evidence.	Weeks 3-4
AI Implementation Specialist	Plausible for bounded integration work; the gap is deployment, monitoring and a client handover that another person can operate.	Weeks 2-4

These are planning judgments, not guarantees of interview selection or employer qualification equivalence.

10. Task 4: Portfolio, organization and submission

Honest completion checklist

- [x] Two role names, rationales and priority weeks drafted.
- [x] More than three skills mapped to each target role.
- [x] Four readable job postings per role reviewed, with evidence IDs and status.
- [ ] Refresh the technical-role sample to three recent postings if strict recency is required.
- [x] Two project narratives and one responsible-AI story drafted.
- [x] One certification chosen with a dated 30-day plan.
- [x] Two role-specific gap actions dated, with additional reinforcement actions.
- [x] Importable calendar and contact/feedback trackers prepared.
- [x] Repository folder structure and file-purpose README created.
- [ ] Verify project claims against the final project files and add exact evidence links.
- [ ] Audit the actual project repositories for setup clarity, secrets and unrelated files.
- [ ] Import the calendar, check conflicts and complete the planned activities.
- [ ] Obtain an external clarity review and record the actual feedback.
- [ ] Create a dedicated GitHub repository, commit these materials and submit its URL if review is required.

Submission workflow

1. Extract the ZIP and open README.md. Read the main report, especially its evidence boundaries.

2. Confirm the proposed reflections and project descriptions. Update only claims supported by your final project artifacts.

3. Keep the lab repository scoped to this package. Do not add backup drives, unrelated projects, certificates containing identifiers, API credentials or private correspondence.

4. Review the evidence links and job status. Refresh older technical listings and adjust counts only after reading replacement postings.

5. Import the ICS calendar into your chosen calendar after reviewing the proposed Europe/Berlin schedule. Importing creates local planning events, not exam bookings or invitations.

6. Create a repository such as post-bootcamp-career-roadmap. Upload README.md, docs, calendar, trackers and portfolio folder notes. Choose repository visibility appropriate to your review arrangement.

7. Open the repository as a reviewer would and test the Markdown, PDF, HTML and source links. Submit the actual repository URL in the lab form. No repository URL is invented here.

Requirement-to-evidence map

Lab requirement	Where addressed	Status
Kick-off questions 1-3; CFU 1	Section 2	Drafted for personal confirmation
Core 1: two roles and market check	Sections 2-3	Completed with explicit recency limitation
CFU 2 / Core 2: two narratives	Section 4	Drafted; project claims need final artifact verification
CFU 3 / Core 3: certification and dates	Section 5; ICS calendar	Planned; not booked or imported
CFU 4 verification	This checklist	Documented, with unperformed actions left open
CFU 5 gap actions	Section 6; calendar	Dated
Core 4: case studies, responsible AI, organization	Sections 4 and 10; portfolio folders	Package prepared; actual repo audit pending
Reinforce: outreach, quota, policy and tech cadence	Sections 6-8; trackers	Drafted and scheduled for import
Stretch: positioning and all-role analysis	Section 9	Drafted; external clarity test pending
README and GitHub submission hygiene	README.md and Section 10	Ready for user upload

11. References and source links

Lab requirements: user-supplied "LAB | Post-Bootcamp Roadmap & Career Planning Extra.pdf", accessed 10 October 2026. This is the authoritative assignment source. The report paraphrases its instructions and does not redistribute the original course PDF.

All web sources below were reviewed on 10 October 2026. They support external role and credential information, not personal achievement claims. The job analysis uses brief paraphrases and skill-family coding; requirements can change or disappear.
